The goal of CAPI is to develop, in consultation with stakeholders, an integrated regulatory strategy for pollutants emitted from electric power plants: sulfur dioxide, nitrogen oxides, and potentially, mercury, which contribute to a variety of health and environmental problems.

---

**Next Steps**

The first phase of the Clean Air Power Initiative has ended. No more large, public CAPI meetings are planned. However, EPA is willing to continue the CAPI dialogue with individuals and organizations as requested. The CAPI analytic tool will continue to inform the OTAG process and the Clean Air Act Advisory Committee Deliberations. The future progress of CAPI depends on the interest and support of the stakeholders. In the meantime, EPA will continue to implement the requirements of the Clean Air Act as planned.
