Welcome to Pennsylvania's West Nile Surveillance Program

In 2000, West Nile virus appeared for the first time in Pennsylvania in birds, mosquitoes and a horse.

To combat the spread of West Nile virus, which is transmitted by mosquitoes, Pennsylvania has developed a comprehensive network.

This network, which covers all 67 counties, includes trapping mosquitoes, collecting dead birds and monitoring horses, people and sentinel chickens.

Explore our site to find out more about how you can help, to learn about West Nile virus or the latest surveillance update from your area.

Surveillance Status

No new cases of West Nile Virus have been identified in the 2001 surveillance season. The map above shows the current distribution of West Nile Virus in Pennsylvania. This map is based on surveillance results from the 2000 season.
